

React

Part 1

jan.schulz@devugees.org

1. Agenda

1. Introduction
2. Hallo World
3. Reasons to use React
4. Core Concepts

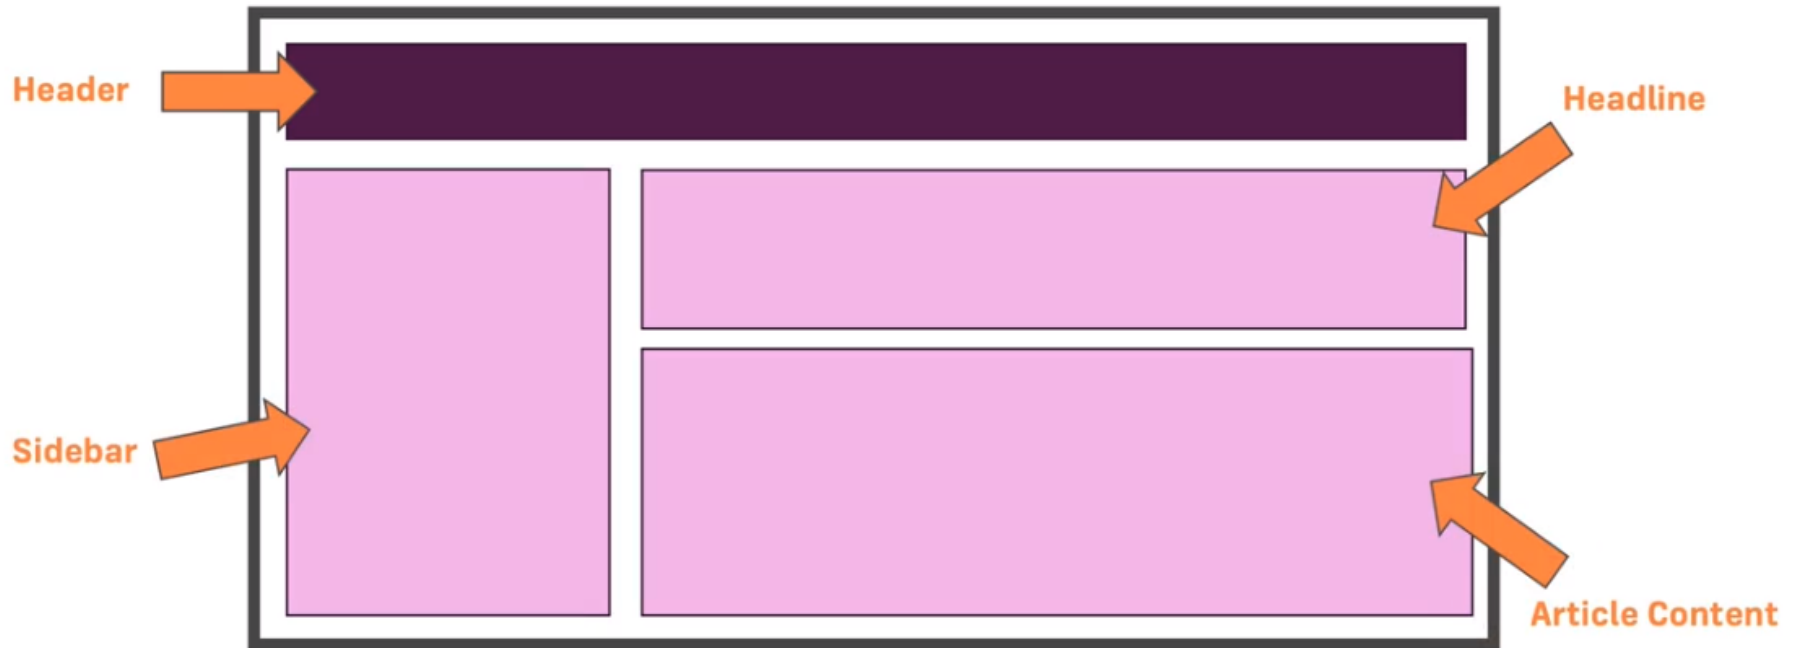

1. Introduction

React is a JS library for building user interfaces.

- React Apps run on the **browser**
- User interfaces are split into **components**

1. Introduction

Components:

1. Introduction

Components:

- Each component contains its separate container of code
- We **do not build** our web app as one bigger picture
- Why?

1. Introduction

Components:

- Each component contains its separate container of code
- We **do not build** our web app as one bigger picture
- Why? – It makes our code more manageable, more maintainable and more reusable
- A react component is like a custom HTML element

2. Hallo World

[coding]

3. Reasons for using React

Why React?

UI State becomes difficult to handle with
Vanilla JavaScript

Focus on Business Logic, not on preventing
your App from exploding

Plus

Huge Ecosystem, Active Community, High
Performance

Framework
Creators
probably
write better
Code

3. Reasons for using React

React Alternatives

Angular

React

Vue

4. Components

- Best Practice, one component will be rendered -> the **App-component**
- All other components are part of the App-component
- Every component has one job: **return JSX** that can be rendered
- JSX is a mixture between HTML and JS

4. Components

5. Arrow Function VS Function

Big Difference:

The „this“-keyword will always keep its context.

```
function myFnc() {  
    ...  
}
```

```
const myFnc = () => {  
    ...  
}
```

6. Props and States

- Props and States are core concepts of React
- Changes in props and states trigger React to re-render components and update the DOM
- Props
 - Allow you to pass data from a parent component to a child component
- States
 - Allow you to change the component from within

7. Events

- <https://reactjs.org/docs/events.html#supported-events>
- Similar to JQuery

8. Stateful VS Stateless Components

Components
defined by
**Arrow
functions**

Use as often as possible

They do not manipulate the application state

Purpose: Only render to DOM

Components
defined by
**class extends
Component**

Only a few selected components

i.e. App, and components which are allowed to change the application state

Purpose: Render and change the state

9. Passing Method References between Components
